Hardware Progression

- 1988: 8 Processors - 512 MB memory

- 1998: 1,024 Processors - 1 TB memory

- 2008: 150,000 Processors - 360 TB memory

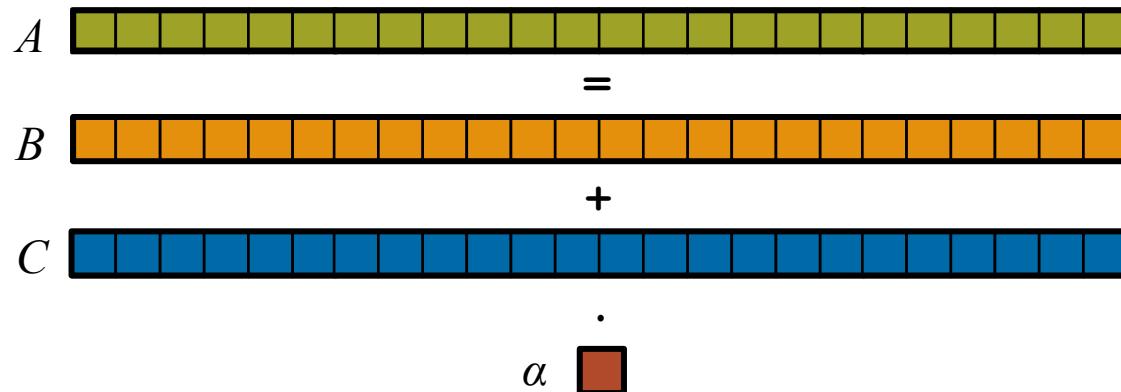

- 2020: 10,000,000 Processors? - ? memory

A trivial parallel computation

Given: m -element vectors A, B, C

Compute: $\forall i \in 1..m, A_i = B_i + \alpha \cdot C_i$

In pictures:

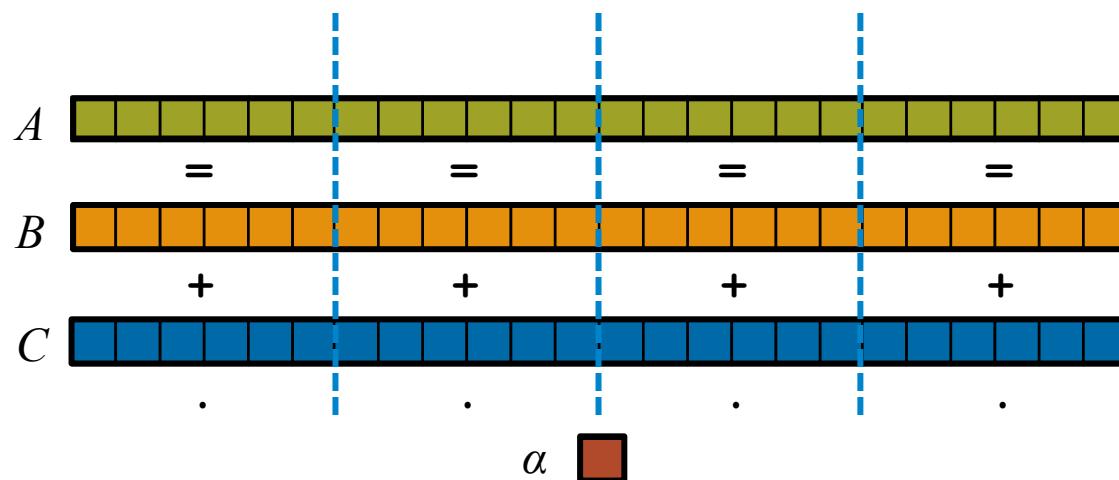

A trivial parallel computation

Given: m -element vectors A, B, C

Compute: $\forall i \in 1..m, A_i = B_i + \alpha \cdot C_i$

In pictures, in parallel:

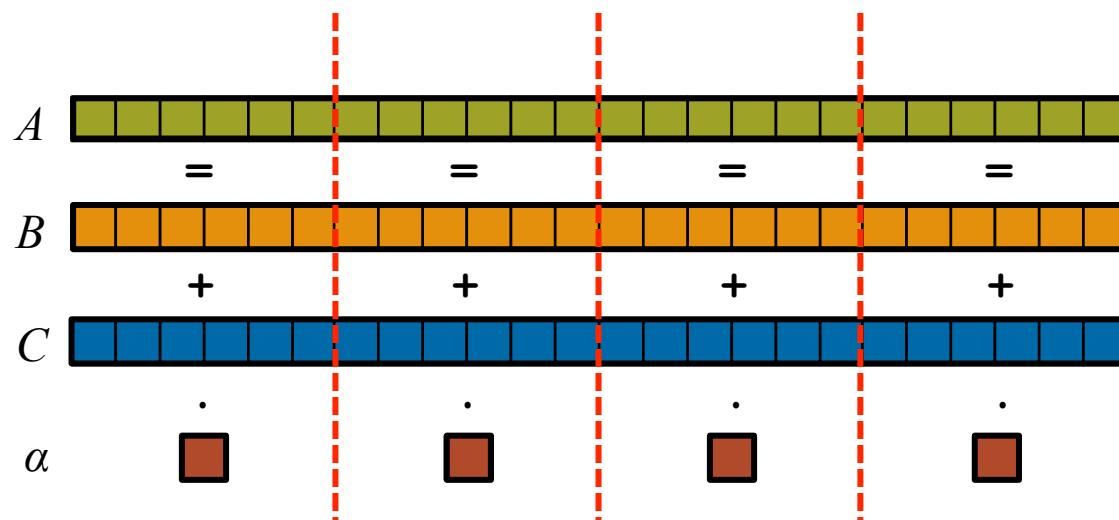

A trivial parallel computation

Given: m -element vectors A, B, C

Compute: $\forall i \in 1..m, A_i = B_i + \alpha \cdot C_i$

In pictures, in parallel (distributed memory):

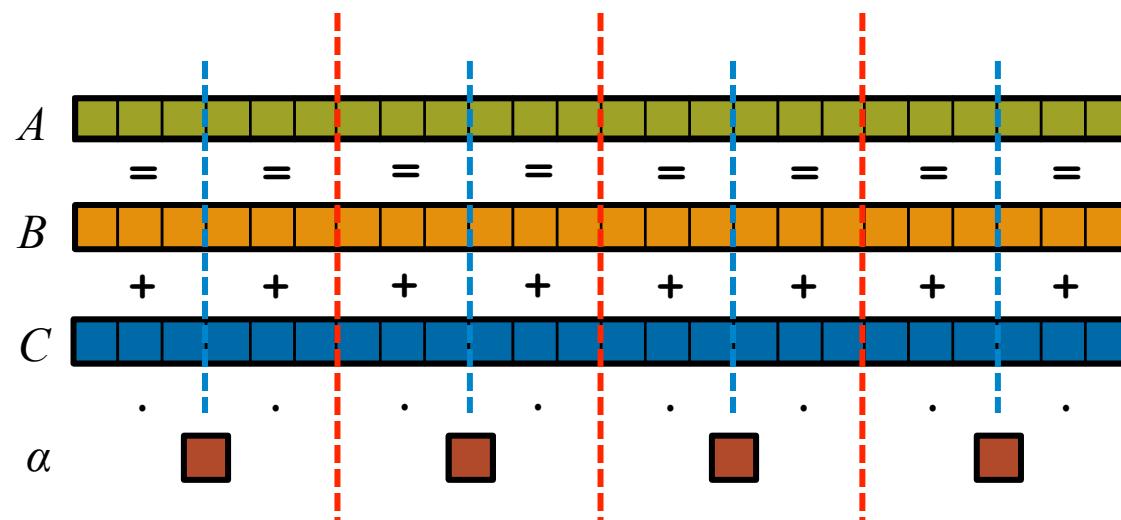

A trivial parallel computation

Given: m -element vectors A, B, C

Compute: $\forall i \in 1..m, A_i = B_i + \alpha \cdot C_i$

In pictures, in parallel (distributed memory multicore):

Existing programming models?

- MPI – C, Fortran, Java
- CUDA, OpenACC for GPUs
- MapReduce
- Custom solutions

Limitations:

- Closely tied to hardware.
- Support single type of parallelism.

What is Chapel?

- An emerging parallel programming language
 - Design and development led by Cray Inc.
- A work-in-progress
- **Chapel's overall goal: Improve programmer productivity**

Chapel's Implementation

- **Open source at SourceForge**
 - Moving to Github soon!
- **BSD license**
- **Target Architectures:**
 - multicore desktops and laptops
 - commodity clusters and the cloud
 - supercomputers
- **Compiler and runtime written in C++/C**
- **Standard library and language features written in Chapel**

Chapel Community

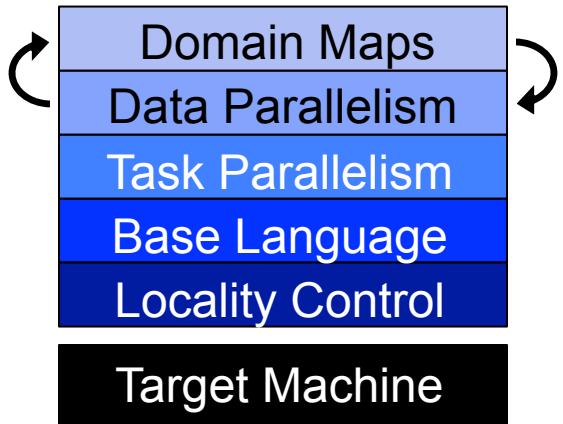

Users:

- 1000+ downloads of each release
- 200 subscribers to chapel-users mailing list

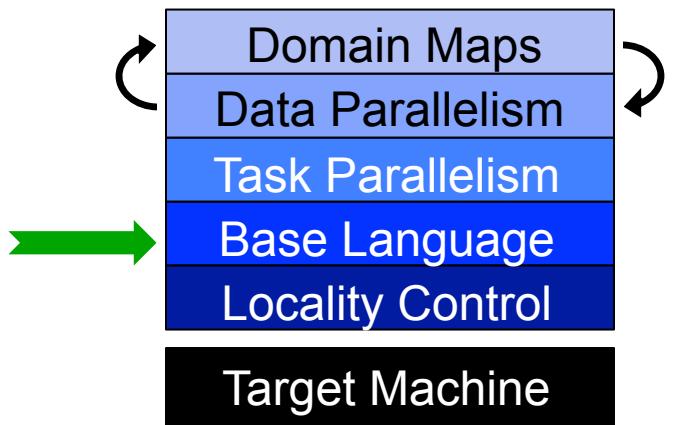

Developers (last release):

- 19 developers
- 8 organizations
- 5 countries

Multiresolution Design

Base Language Features

Static Type Inference

```
const pi = 3.14,          // pi is a real
      coord = 1.2 + 3.4i, // coord is a complex...
      coord2 = pi*coord,  // ...as is coord2
      name = "foo",       // name is a string
      verbose = false;    // verbose is boolean

proc addem(x, y) {        // addem() has generic arguments
    return x + y;          // and an inferred return type
}

var sum = addem(1, pi),    // sum is a real
    fullname = addem(name, "bar"); // fullname is a string

writeln((sum, fullname));
```

(4.14, foobar)

Range Types and Algebra

```
const r = 1..10;

printVals(r # 3);
printVals(r by 2);
printVals(r by -2);
printVals(r by 2 # 3);
printVals(r # 3 by 2);
printVals(0.. #n);

proc printVals(r) {
    for i in r do
        write(i, " ");
        writeln();
}
```

```
1 2 3
1 3 5 7 9
10 8 6 4 2
1 3 5
1 3
0 1 2 3 4 ... n-1
```

Iterators

```
iter fibonacci(n) {
    var current = 0,
        next = 1;
    for i in 1..n {
        yield current;
        current += next;
        current <=gt; next;
    }
}
```

```
for f in fibonacci(7) do
    writeln(f);
```

```
0
1
1
2
3
5
8
```

Zippered Iteration

```
for (i,f) in zip(0..#n, fibonacci(n)) do  
    writeln("fib #", i, " is ", f);
```

```
fib #0 is 0  
fib #1 is 1  
fib #2 is 1  
fib #3 is 2  
fib #4 is 3  
fib #5 is 5  
fib #6 is 8  
...
```

Classes

```
class Circle {  
    var x, y: int;  
    var r: real;  
}  
  
var c = new Circle(r=2.0);  
  
proc Circle.area()  
    return pi*r**2;  
writeln(c.area());  
  
class Oval: Circle {  
    var r2: real;  
}  
  
proc Oval.area()  
    return pi*r*r2;  
  
var o: Circle = new Oval(r=1.0, r2=2.0);  
writeln(o.area());
```

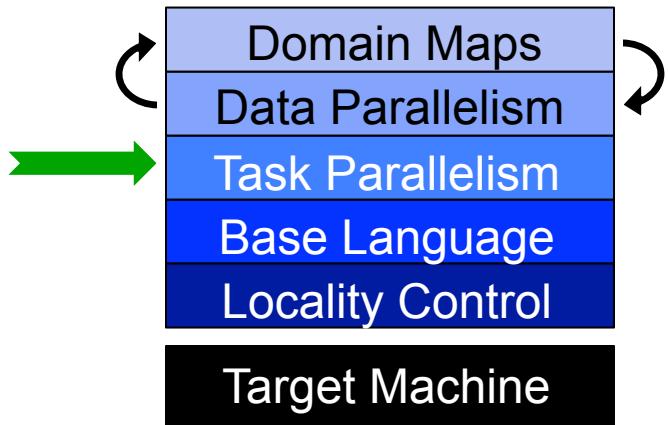

12.56

6.28

Other Base Language Features

- tuple types and values
- records
- modules
- unions
- enums
- interoperability features

Task Parallel Features

Tasks: discrete units of computation that can, and should, be executed in parallel.

Coforall Loops

```
coforall t in 0..#numTasks {
    writeln("Hello from task ", t, " of ", numTasks);
} // implicit join of the numTasks tasks here

writeln("All tasks done");
```

Sample output:

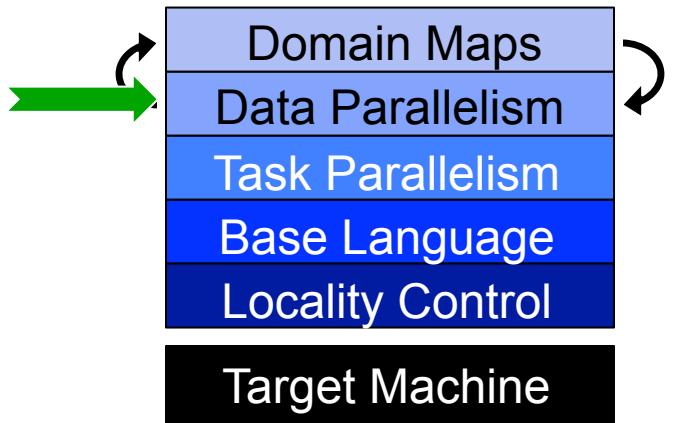

```
Hello from task 2 of 4
Hello from task 0 of 4
Hello from task 3 of 4
Hello from task 1 of 4
All tasks done
```

Other Task Parallel Features

- **begin, cobegin**
- **synchronization blocks**
- **atomic and synchronization variables**

Data Parallel Features

Forall Loops

```
forall a in 1..n do  
    writeln("Here is an a: ", a);
```

Typically $1 \leq \# \text{Tasks} \ll \# \text{Iterations}$)

```
forall (a, i) in zip(A, 1..n) do  
    a = i/10.0;
```

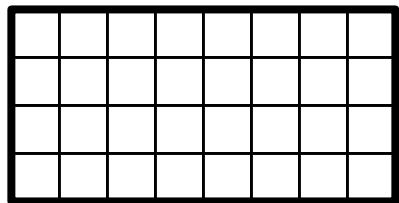

Forall-loops may be zippered, like for-loops
• Corresponding iterations will match up

Domains

Domain:

- First-class index set
- Used to declare and operate on arrays
- Drive iteration

```
config const m = 4, n = 8;  
  
var D: domain(2) = {1..m, 1..n};
```

D

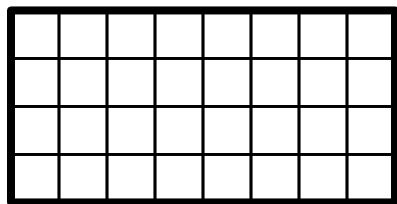

Arrays

```
config const m = 4, n = 8;

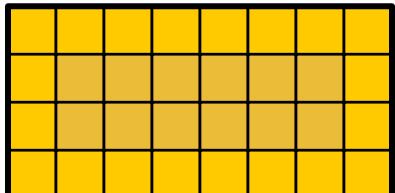

var D: domain(2) = {1..m, 1..n};

var A: [D] real;
var B: [D] string;
```

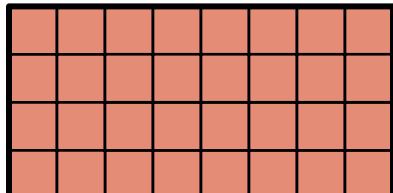

```
forall (i, j) in D {
    A(i, j) = i + j/10.0;
    B(i, j) = i + "," + j;
}
```

D

A

B

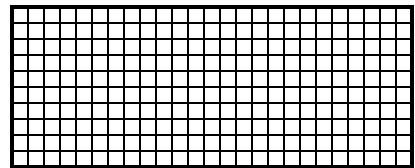

1.1	1.2	1.3	1.4	1.5	1.6	1.7	1.8
2.1	2.2	2.3	2.4	2.5	2.6	2.7	2.8
3.1	3.2	3.3	3.4	3.5	3.6	3.7	3.8
4.1	4.2	4.3	4.4	4.5	4.6	4.7	4.8

A

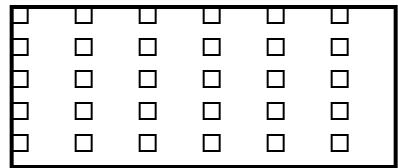

1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8
2,1	2,2	2,3	2,4	2,5	2,6	2,7	2,8
3,1	3,2	3,3	3,4	3,5	3,6	3,7	3,8
4,1	4,2	4,3	4,4	4,5	4,6	4,7	4,8

B

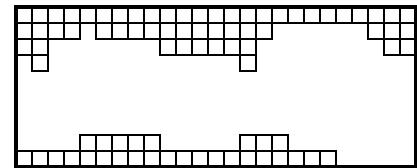

Chapel Domain Types

dense

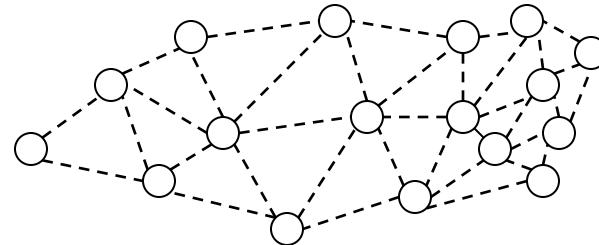

strided

sparse

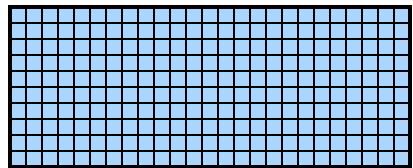

associative

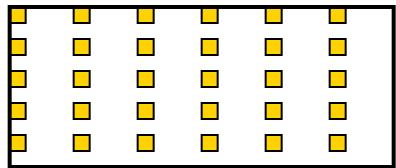

unstructured

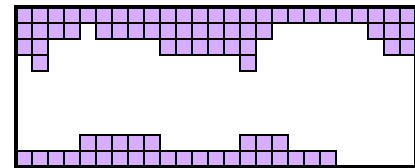

Chapel Array Types

dense

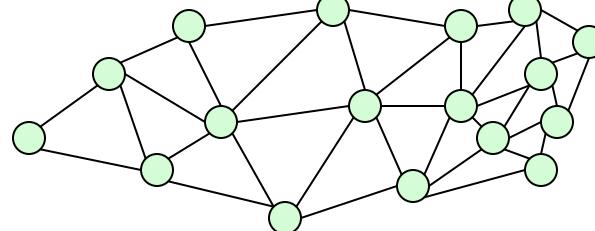

strided

sparse

associative

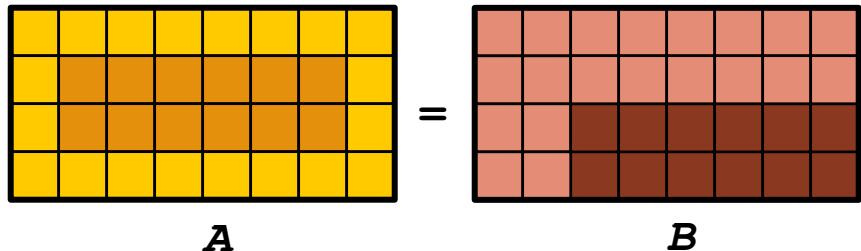

unstructured

Chapel Domain/Array Operations

- **Array Slicing; Domain Algebra**

```
var InnerD: subdomain(D) =  
  {2..m-1, 2..n-1};  
A[InnerD] = B[InnerD+(1,1)];
```

- **Promotion of Scalar Operators and Functions**

```
A = B + alpha * C;
```

```
A = exp(B, C);
```

```
A = foo(B, C);
```

Promotion Semantics

Promoted functions/operators are defined in terms of zippered forall loops in Chapel. For example...

A = B;

\Rightarrow

```
forall (a,b) in zip(A,B) do
    a = b;
```

Whole-array operations are implemented element-wise.

A = B + alpha * C;

\Rightarrow

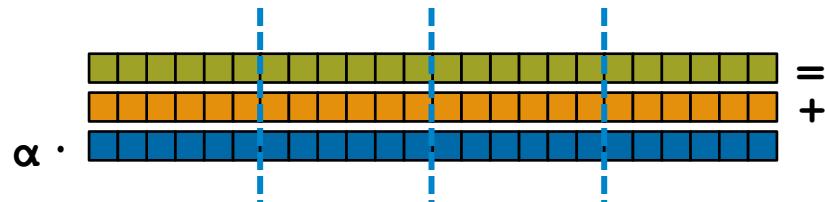

```
forall (a,b,c) in (A,B,C) do
    a = b + alpha * c;
```

Trivial Example: Chapel (multicore)

```
const ProblemDomain = {1..m};
```

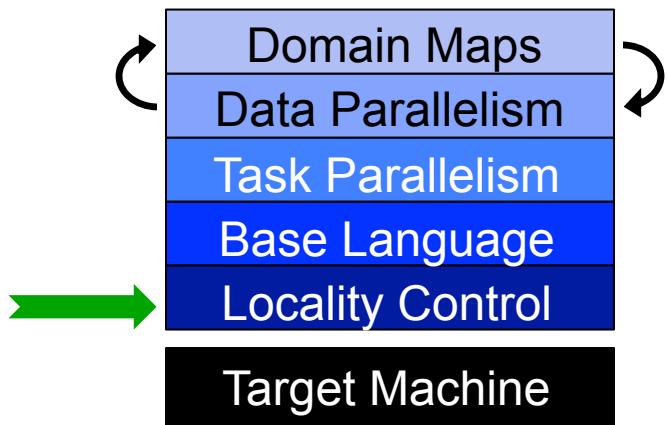

```
var A, B, C: [ProblemDomain] real;
```

```
A = B + alpha * C;
```

Locality Control Features

Locale: abstract unit of target architecture that can run tasks and store variables.

Defining Locales

- Specify # of locales when running Chapel programs

```
% a.out --numLocales=8
```

- Chapel provides built-in locale variables

```
config const numLocales: int = ...;  
const Locales: [0..#numLocales] locale = ...;
```

Locales

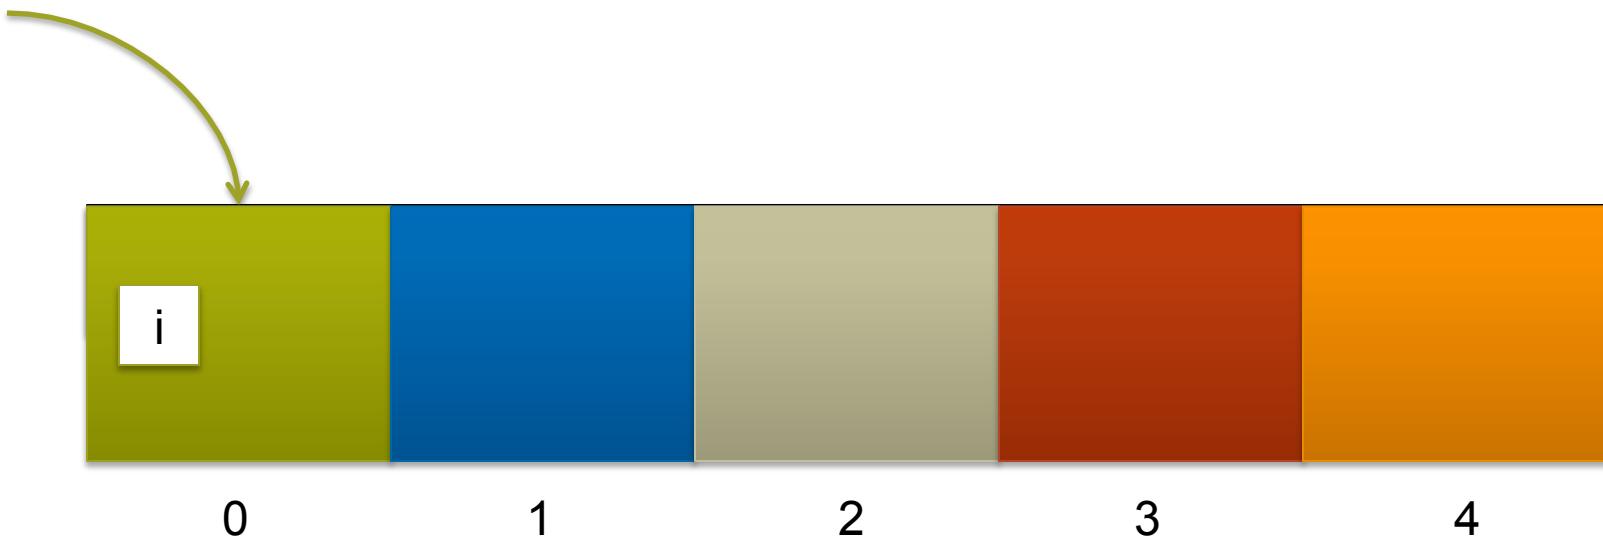

- User's main () begins executing on locale #0

Chapel: Scoping and Locality

```
% a.out --numLocales=5
```

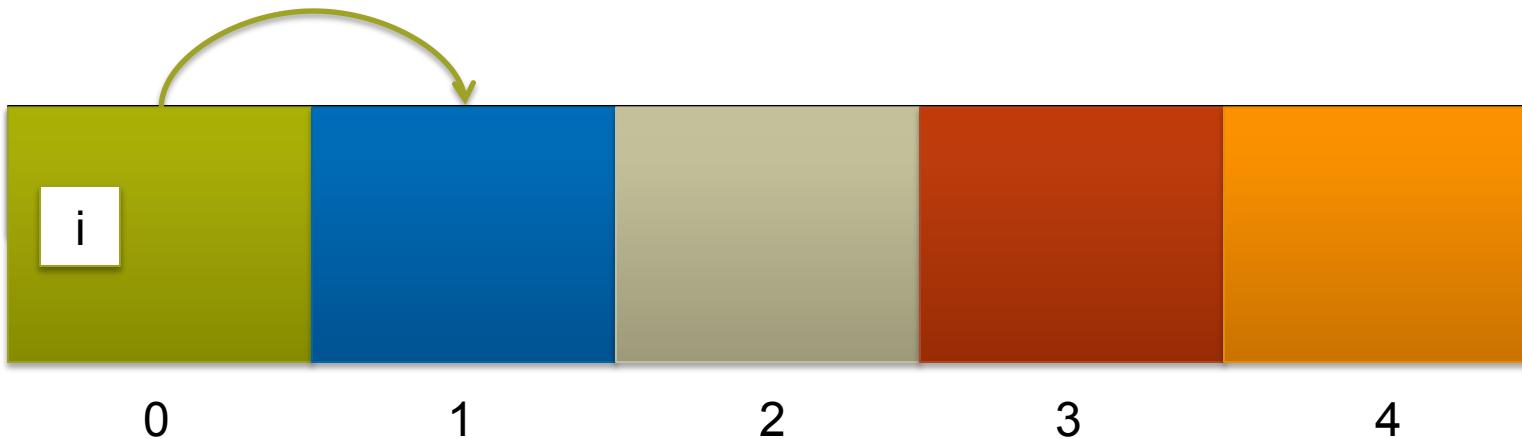

```
var i: int;
```

Chapel: Scoping and Locality

```
% a.out --numLocales=5
```

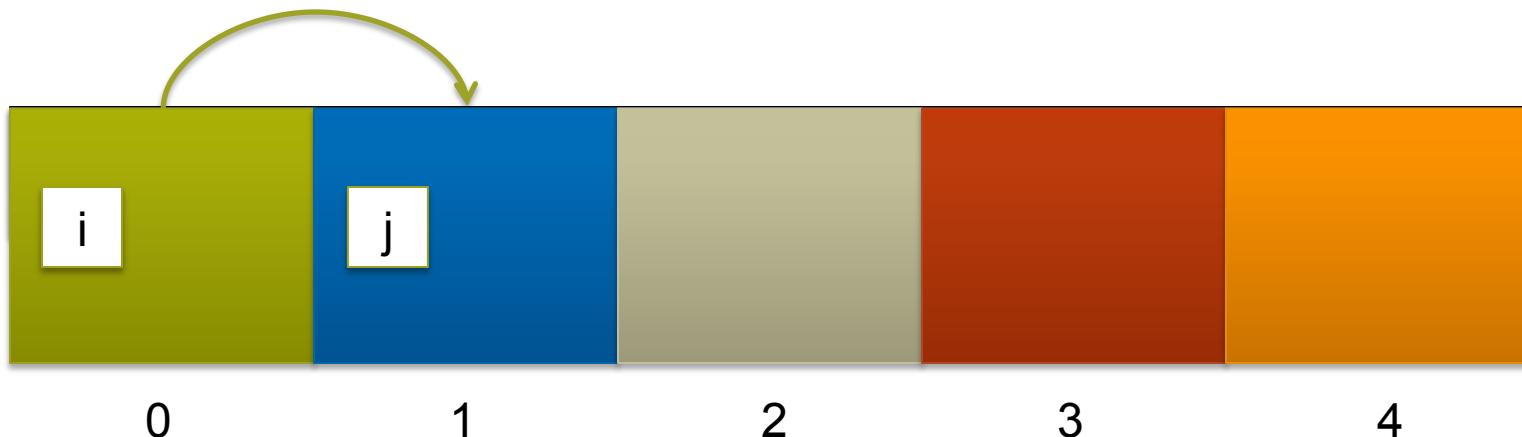

```
var i: int;  
on Locales[1] {
```

Chapel: Scoping and Locality

```
% a.out --numLocales=5
```

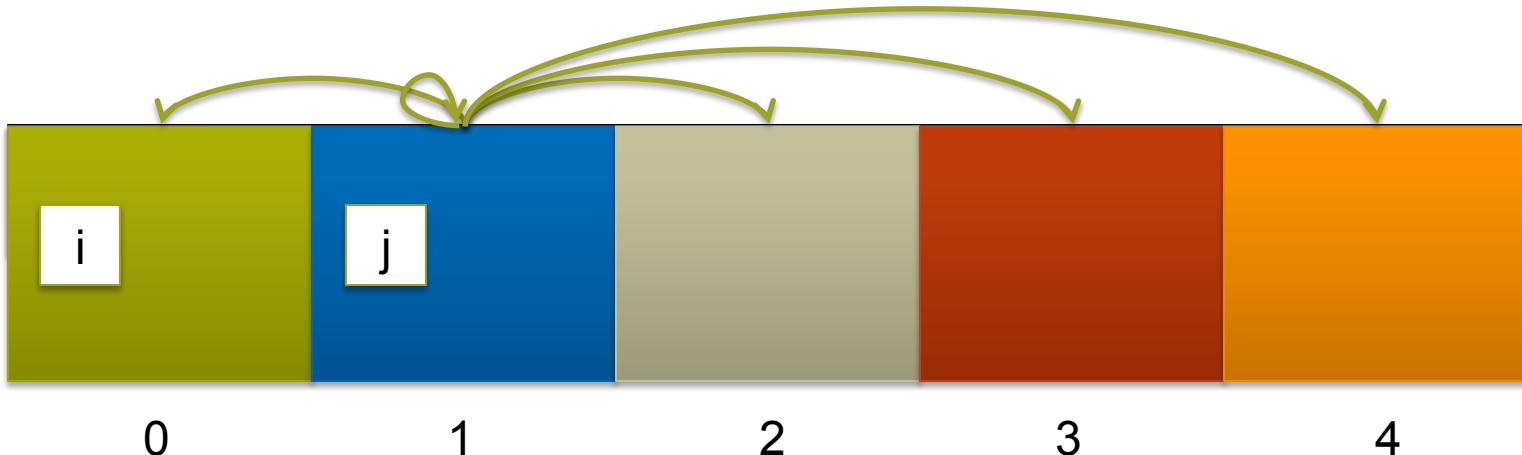

```
var i: int;  
on Locales[1] {  
    var j: int;
```

Chapel: Scoping and Locality

```
% a.out --numLocales=5
```

```
var i: int;  
on Locales[1] {  
    var j: int;  
    coforall loc in Locales {  
        on loc {
```

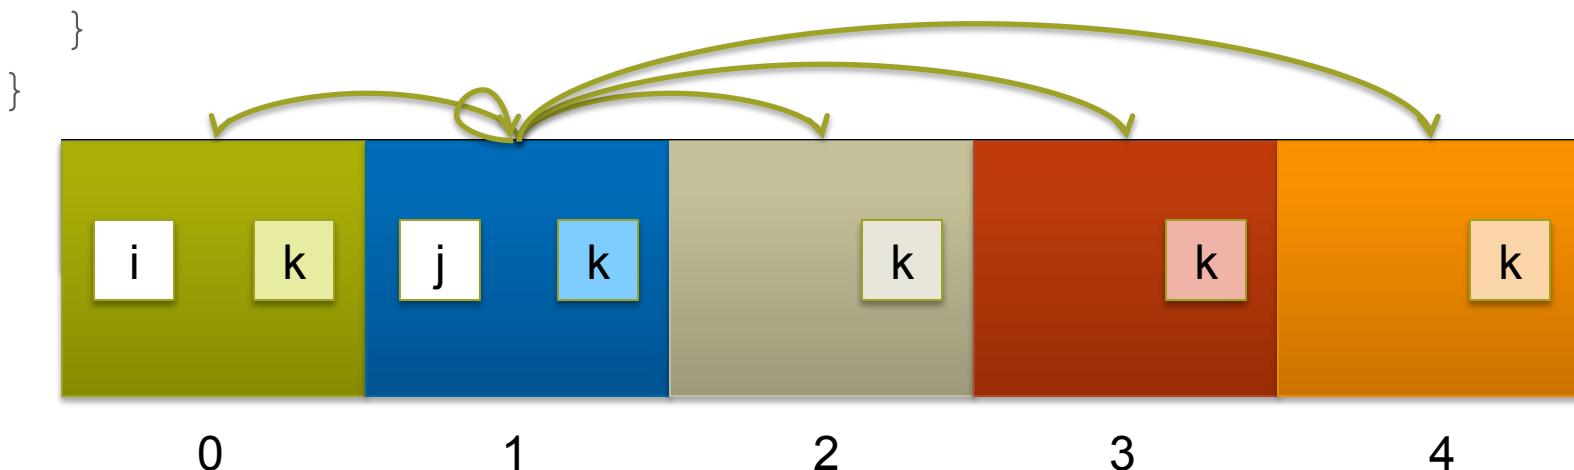

Chapel: Scoping and Locality

```
% a.out --numLocales=5
```

```
var i: int;
on Locales[1] {
    var j: int;
    coforall loc in Locales {
        on loc {
            var k: int;

            // within this scope, i, j can be referenced;
            // the implementation manages the communication
        }
    }
}
```

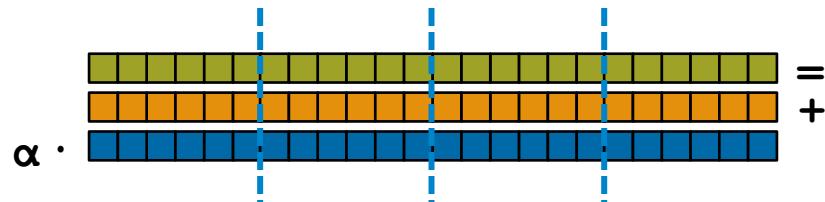

Trivial Example: Chapel (multicore)

```
const ProblemDomain = {1..m};
```

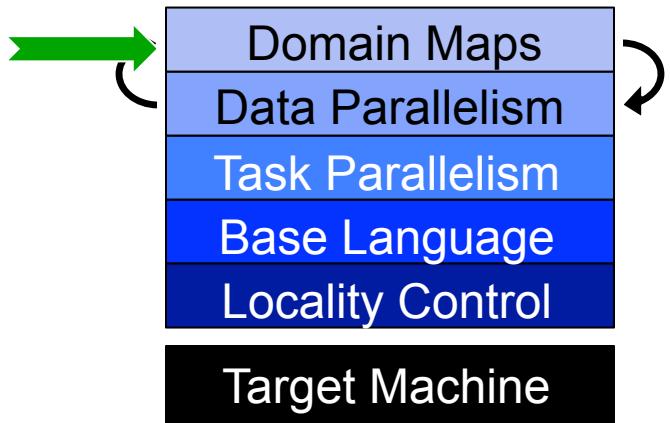

```
var A, B, C: [ProblemDomain] real;
```

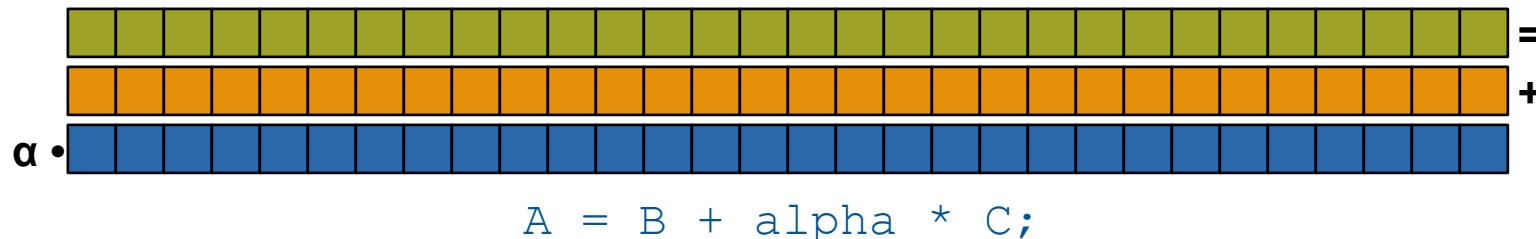

```
A = B + alpha * C;
```

Domain Map Features

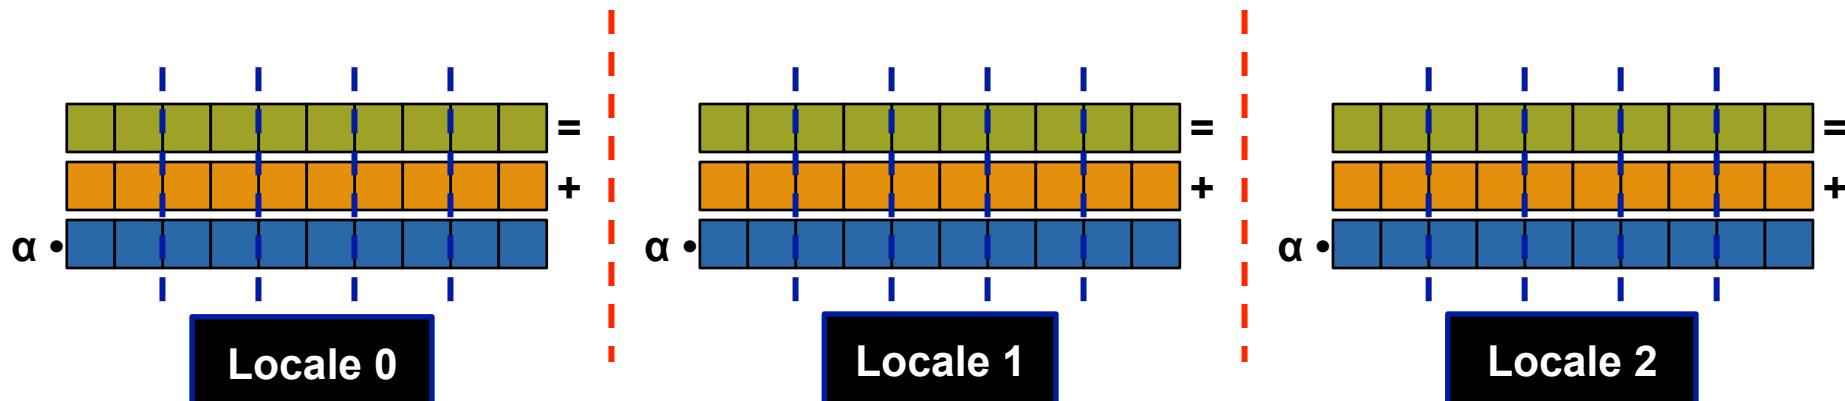

Domain Maps

Domain maps are “recipes” that instruct the compiler how to map the global view of a computation...

...to the target locales' memory and processors:

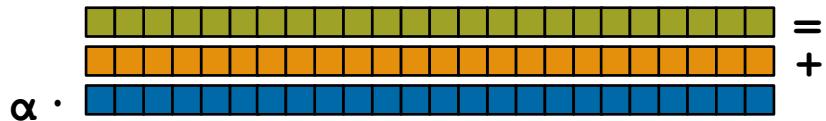

Trivial Example: Chapel

```
const ProblemDomain = {1..m};
```

```
var A, B, C: [ProblemDomain] real;
```

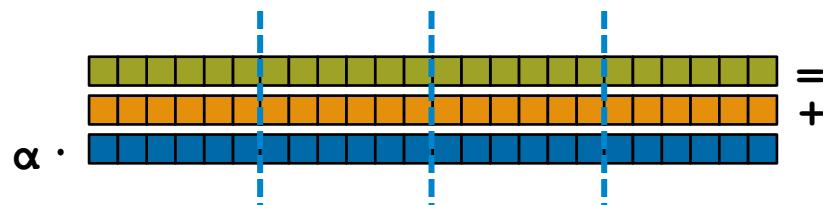

```
A = B + alpha * C;
```

Trivial Example: Chapel (multicore)

```
const ProblemDomain = {1..m};
```

```
var A, B, C: [ProblemDomain] real;
```

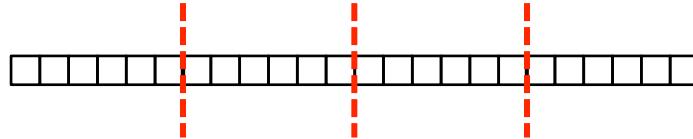

```
A = B + alpha * C;
```

No domain map specified => use default layout

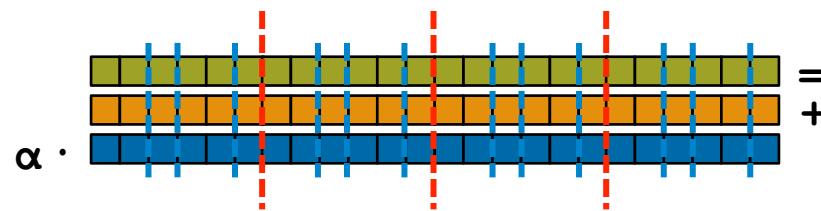

- current locale owns all indices and values
- computation will execute using local processors only

Trivial Example: Chapel (multilocal, blocked)

```
const ProblemDomain = {1..m}  
                      dmapped Block({1..m});
```

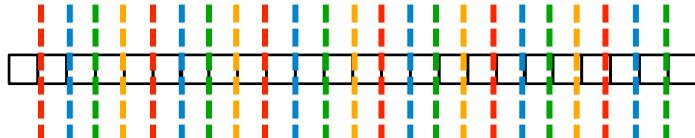

```
var A, B, C: [ProblemDomain] real;
```

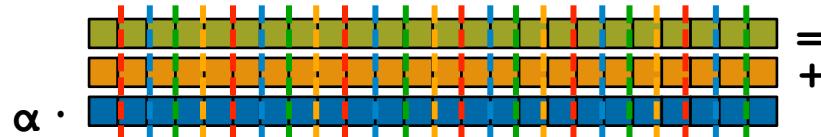

```
A = B + alpha * C;
```

Trivial Example: Chapel (multilocal, cyclic)

```
const ProblemDomain = {1..m}  
                      dmapped Cyclic(startIdx=1);
```

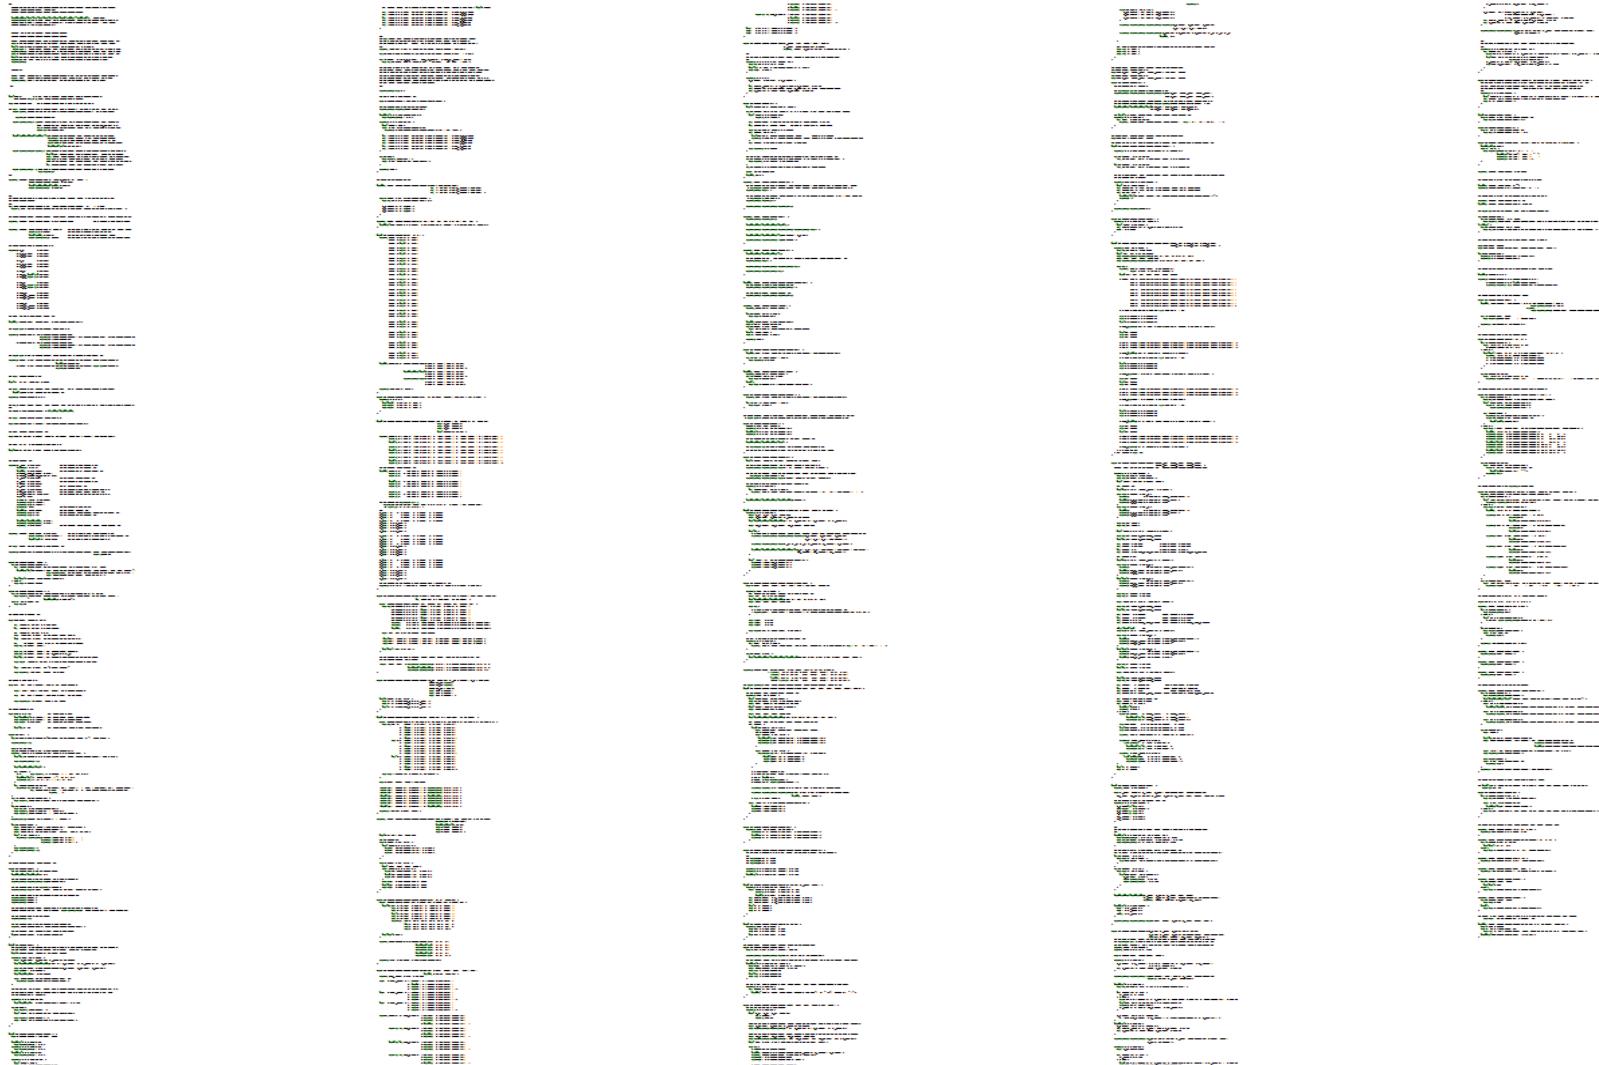

```
var A, B, C: [ProblemDomain] real;
```

```
A = B + alpha * C;
```

LULESCH in Chapel

The image displays a grid of 100 terminal windows, each showing the execution of LULESCH code in Chapel. The windows are arranged in a 10x10 grid. Each window contains several lines of command-line output, indicating the progress of the code execution. The output includes various system messages, error logs, and performance metrics. The overall appearance is that of a high-performance computing environment, likely running on a Cray system.

LULESCH in Chapel

This is all of the representation dependent code.
It specifies:

- data structure choices
 - structured vs. unstructured mesh
 - local vs. distributed data
 - sparse vs. dense materials arrays
- their corresponding iterators

Implementation Status -- Version 1.9.0 (Apr 2014)

Overall Status:

- Most features work at a functional level
- Many performance optimizations remain

This is a good time to:

- Try out the language and compiler
- Use Chapel for non-performance-critical projects
- Give us feedback to improve Chapel
- Use Chapel for parallel programming education

Chapel: the next five years

- Harden Prototype to Production-grade
- Target more complex/modern compute node types
- Continue to grow the user and developer communities
